

# How to run the program

The python program for the stock predictor uses tkinter for the GUI. I created the project on Python 2.7. Some of the packages imported in the program differs in Python 3.6, and thus would result in errors if run using Python 3.6.

The following are the requirements to run the code:

## 1) Extract the zip file

## 2) Installations:

- 1) Python 2.7
- 2) Tkinter for Python 2.7: `sudo apt-get install python-tk`

Once these are installed, just run

*python PredictStock.py*

This should open a window for the application.

## 3) How to use:

- 1) Select the company stock initials
- 2) Select the number of days
- 3) Click on generate graph to get the prediction
